

Kush Bhatnagar

Bangalore, India kushbhatnagar86@gmail.com linkedin.com/in/kushbhatnagar

Technical Product Manager with 17+ years in technology, including 5+ years in product management — owning roadmaps for AI/GenAI platforms, access-governance systems, and cloud-native ML infrastructure, and now leading agentic AI transformation of Product Management workflows by building and scaling AI agents hands-on. Skilled at translating complex backend workflows into clear product requirements, prioritizing against business value and engineering capacity, and partnering daily with Engineering, UX, and Security to ship reliable, self-service capabilities at enterprise scale.

EXPERIENCE

HP Inc.

Product Manager – AI Platform

Jan 2025 – Present

- Defined vision for HP's internal AI platform, enabling 10+ teams to access public/proprietary LLMs via a unified API and standardized model integrations, reducing onboarding time by 60%.
- Built an agent spanning the full PM lifecycle, from market research and lean business case to PRD, specification, and Jira epic creation, with human review at every stage; cut each stage from weeks to about 2-3 days.
- Built a unified PM agent that, across 12 PRDs and 4 grooming cycles, saved an estimated 2-3 hours per PRD in pre-planning and 3-4 hours per grooming cycle, and let engineers clarify requirements and acceptance criteria without repeated PM follow-ups.
- Built AI agents in Microsoft Copilot Studio to automate Product Management and Engineering workflows, integrating MCP connectors and tools including a Jira API connector and a Word document writer.
- Wrote GitHub Copilot custom skills for daily PM work (PRDs, product artifacts, presentations), backed by a local RAG system over project context; adopted by another PM, who reported gains in daily productivity and artifact quality.
- Scaled agent adoption beyond the home organization through live workshops, published training material, and six months of office hours across US and India time zones reaching 100+ invited colleagues; 5+ PMs in other organizations built and began using their own agents.
- Enabled AI skill reuse across 10+ internal product teams, cutting duplication and improving consistency.
- Standardized API gateways and technical integrations across AWS & Azure, ensuring reliable, secure connections to backend AI services; cut redundant engineering effort by 40%.
- Operationalized governance, access controls, and observability, aligning AI delivery with enterprise-grade compliance standards.
- Introduced self-service usage tracking and role-based access controls, eliminating 90% of untracked usage.
- Acted as first consumer of AI Platform capabilities, implementing reference scenarios and writing partner-perspective user journeys to surface documentation, usability, and integration gaps before broad adoption.
- Brought Product Management into AI governance requests from first contact, scheduling discussions within one working day and cutting initial response time from 4-5 days to 1-2 days.
- Defined requirements for an AI Gateway usage and billing dashboard with Architecture and Engineering, embedding token-economics acceptance criteria and partner-specific instrumentation (e.g., image-generation counts) as the foundation for consumption-based cost allocation.

Product Manager – Diagnostic Platform

Jan 2023 – Dec 2024

- Owned the roadmap for a Diagnostics platform used by cross-functional engineering teams, improving issue resolution efficiency by 30%.
- Partnered with Engineering and UX to map critical user journeys and prioritize the backlog, enabling 25% faster delivery.
- Authored 100+ user stories with structured acceptance criteria, translating complex backend workflows into clear product requirements; cut rework by 15%.
- Prevented a 2-month delay through proactive risk mitigation and dependency tracking across data pipelines.

Technical Program Manager – Large Format Print ML

Jan 2022 – Dec 2022

- Owned requirement prioritization for the engineering team, weighing each business ask against its criticality and the team's available bandwidth to decide what got built and when.
- Led MLOps delivery and data-ingestion pipeline operations across LFP ML initiatives; reduced deployment cycle by 35%.

- Built scalable model infrastructure with Kubernetes & Docker to support continuous data ingestion and reliable model processing; reduced infra overhead by 40%.
- Conducted SageMaker Studio POCs to optimize cloud compute utilization for ML workloads, informing cloud-native deployment strategy.
- Drove MLOps best practices adopted across 5+ business units.

Technical Program Manager – Manage Print Solutions

Jan 2021 – Dec 2021

- Served as the escalation point for customer issues, validating each against actual product gaps and converting legitimate asks into structured requirements for the engineering team.
- Defined and implemented the SIT process, improving defect traceability and test cycle time by 35%.
- Developed a SIT automation framework, increasing test coverage by 50%.

System Engineer – HP ePrint Cloud Platform

Nov 2016 – Dec 2020

- Built an API automation framework integrated with CI/CD, reducing regression test time by 40%.
- Led an engineering team to deliver cost-effective features with 15% better on-time delivery.

JDA

Senior QA Engineer – Agile Business Process Platform

Nov 2012 – Oct 2016

- Created a Selenium-based UI framework (POM), improving test execution speed by 50%.
- Developed test strategy aligned with business-critical workflows, surfacing 30% more pre-UAT issues.

Accenture

Senior Software Engineer – Credit Decisioning Platform

Jul 2009 – Oct 2012

- Built a QTP-based regression suite, reducing defect leakage by 30%.
- Implemented Risk-Based Testing, cutting QA turnaround by 25%.

INNOVATION & TECHNICAL PROJECTS

Regression Test Case Selection using Machine Learning: Developed an ML-based solution to automate regression test case selection, reducing manual effort and improving prioritization accuracy in resource-constrained testing cycles.

Monitoring Interdependent Microservices using AIOps: Built a prototype leveraging AIOps principles to monitor cloud-native microservices, applying machine learning on integrated IT telemetry for proactive incident detection and automated remediation insights.

SKILLS

Product & Program Management	Product Strategy, Roadmapping, Requirement Prioritization, CUJ/JTBD Mapping, Agile (JIRA, SAFe), Backlog Grooming, Stakeholder Management
Platform & Access Management	API Gateway Design, Role-Based Access Control (RBAC), Usage Governance, Privacy & Compliance Controls, Observability
Cloud & DevOps	AWS (SageMaker, EC2, S3, EKS), Azure, Kubernetes, Docker, CI/CD (Jenkins, GitHub Actions)
AI/ML & Agentic AI	AI Agents (Microsoft Copilot Studio), MCP Connectors & Tool Integrations, GitHub Copilot Custom Skills, RAG, Prompt Engineering, MLFlow, SageMaker Studio, Kubeflow, DVC, Model Deployment & Monitoring, AI Model API Integrations, AIOps Concepts
Programming & Tools	Python, Java, Flask, FastAPI, REST APIs, Pandas, NumPy
Testing & Automation	Selenium, JMeter, Test Automation, Regression & Risk-Based Testing

EDUCATION & CERTIFICATIONS

Bachelor of Engineering in Information Technology Rajasthan University, Jaipur | Graduated: Aug 2008 | GPA: 3.5 (Honours)

AWS Certified Solutions Architect – Associate · AWS Certified Machine Learning – Specialty

ACTIVITIES

Author of BlogsByKush.com, simplifying complex AI, MLOps, and Cloud topics for professionals and practitioners.
